

Coach Mode, start to finish

One counselor, many client businesses — imported, searched, and worked **as if you were each of them**. Every beat below is tied to a route already verified live on **getmindy.ai**. Target run: **~8 minutes**, then questions.

PRE-FLIGHT — DO THIS BEFORE THEY WALK IN

- ✓ Signed into **getmindy.ai/app** as eric@govcongiants.com
- ✓ NCMBC org active org_admin · unlimited clients
- ✓ Clients pre-cleared OR pre-loaded decide: live import vs. already-full
- ✓ Hard-refresh once (picks up the live build; refreshes your session)
- ✓ 60-business NC roster on clipboard ncmbsample-clients.txt
- ✓ Second screen = this sheet projector = the app only

THE FLOW

6 beats • ~8 min

1

≈ 60 SEC • FRAME IT

The problem you already live with

DO Stay on the app home. Don't click yet — talk.

“You each counsel dozens of small businesses. Today that's dozens of spreadsheets, logins, and sticky notes. Watch what it looks like when one counselor runs all of them from a single seat.”

AUDIENCE SBDC / APEX counselors — they feel the many-clients pain instantly. Name it back to them.

2

≈ 90 SEC · THE HOOK

Import the whole roster at once

DO Open **My Clients** → **Import a client roster** → paste the 60 NC businesses → **Import**.

SHOW The progress bar chunking through, then the summary: **added / duplicates / rejected**. Each business became its own workspace with real NAICS + keywords seeded from its capability text.

“Sixty businesses, one paste. Each one now has its own profile — not a name in a list, a real working workspace.”

IF PRE-LOADED Skip the paste; scroll the populated list instead and say "this is a roster I imported earlier in one shot."

LIVE **POST** `/api/app/coach` · action `bulk_import`

· cap math unit-tested (enterprise = unlimited)

3

≈ 45 SEC · SCALE

Find one client instantly

DO Type a few letters in the client search — e.g. **caro** or **aero**.

SHOW The list filters as you type, no lag, count stays honest. This is the "200 clients is still usable" proof.

“Whether you manage six clients or six hundred, you're one search away from any of them.”

LIVE **GET** `/api/app/coach` · instant client-side filter, server paginates past 200

4

≈ 90 SEC · THE "WOW"

Become that client

DO On a client card, click **Work as [name]**.

SHOW The whole app re-scopes to that business — their pipeline, their target agencies, their research. You're operating inside their workspace, not looking at a report about them.

“Now I'm not looking at their account — I'm working in it. Everything I do here is theirs.”

LIVE `GET /api/app/workspace · x-active-workspace` switch, authorization-gated

5

≈ 2 MIN · THE VALUE

Do real work for them

DO From the switched-in client, open **Target agencies**, then **Market research**, then **Pipeline**.

SHOW Agencies they should pursue, live opportunities for their NAICS, and a pipeline to track pursuits. Point out it's grounded in real USASpending / SAM data, not made up.

“In one session you gave this client a target list, live opportunities, and a pipeline. Multiply that across your whole caseload.”

DEPTH Have ONE client picked in advance whose research looks strong (construction
PICK or IT/cyber). Don't gamble on a random one live.

LIVE `/api/app/target-list · /api/market-scanner · /api/pipeline`

– all scoped to the active client

6

≈ 60 SEC · LAND IT

Step back to the coach seat

DO Switch back out to **My Clients**. Land on the full roster view.

“One counselor. One login. Every client's BD run from here — and it's built to white-label as your program's own. That's Coach Mode.”

ROADMAP If asked "can it be OUR brand / assign counselors / report to funders?" — yes, that's Phase 2 (org-admin, assignment, funder reporting, branding). Engine's built; say "coming," don't demo it.

ACT 2 – IF THEY LEAN IN

optional · pick one

Only if the room wants more. These aren't demo steps — they're the two strongest "what else does it do?" answers, both **live today**. Show **one**, not both. The proposal sells ~80% of Mindy already; these are the pieces that land hardest with counselors.

A

≈ 90 SEC · THE SLEEPER — best for an SBDC/APEX room

Your own playbook, made searchable

DO Open **Knowledge Base**. Type a real question in the search box.

SHOW It answers from an ingested corpus — for a partner org, that's **your own internal guidance docs**. This is the "Custom AI Workbench" the proposal names.

“Load your center's playbooks in here and a counselor can ask "what guidance did we give construction firms in this county?" — instead of digging through a shared drive.”

WHY IT LANDS Counselors live in their own guidance. This turns a filing cabinet into an answer engine — the proposal's real differentiator.

LIVE GET </api/app/knowledge-base>

· RAG over the org corpus · ingest their docs per-org

B

≈ 60 SEC · THE MORNING DASHBOARD

"Who on my caseload has something due?"

DO Back on **My Clients**, scroll to the **Org Tab** feed under the roster.

SHOW Across ALL your clients at once: upcoming **deadlines**, recent **change alerts**, and admin-posted **internal news** — one glance.

"This is a counselor's Monday morning: every client's deadline across the whole caseload, red-flagged, on one screen."

NOTE The feed shows only if your clients have tracked pursuits with deadlines — pre-seed one or two so it isn't empty.

LIVE

GET `/api/app/coach` · Org Tab: cross-client deadlines + changes + **org_news**

IF THEY ASK "CAN IT DO X?" — NAME IT, DON'T DEMO IT

All roadmap (Phase 2 / v2), engine partly built. Say *"that's coming"* with confidence — never present these as missing. ★ = matters most to a funded center

★ Funder / ROI reporting (NCMBC → DoD outcomes)

★ White-label branding (your logo, colors, domain)

Counselor management + client assignment

Org-admin dashboard + seat billing

Deep integrations (Slack · Outlook · Drive)

SSO / SAML

IF SOMETHING WOBLES – RECOVER, DON'T APOLOGIZE

A panel errors Hard-refresh once (fixes an expired session — the auth self-heal is deployed) and continue. Don't debug on the projector.

Import feels slow It chunks in batches — narrate it: "it's provisioning a real workspace per business." Slowness reads as substance here.

A client's research is thin Switch to your pre-picked strong client. Never let a sparse result be the thing on screen.

Asked about isolation "Each client is scoped by org and workspace, enforced in the app and backstopped in the database." True, audited, and enough — don't go deeper.

Asked about SAM "higher access" "Award data's already live via USASpending; the SAM system account only adds subaward depth." Don't frame it as missing.

They say "OpnGovIQ" That's the name in the proposal — bridge without a beat: "right, that's the product you're looking at — Mindy." Don't correct, just continue.

Verified live end-to-end · import confirmed working in-session.
